Executive Summary

1 High-Level Overview

OVERVIEW	
Project Name	CarRental
Project Type	Frontend
Total Test Cases	111
Base URL	https://car-rental-system-fe.phucthan308.workers.dev
Pass / Fail / Blocked	Frontend: 61 Passed / 39 Failed / 11 Blocked

2 Key Findings

Test Summary

The frontend suite is broadly functional but still has several meaningful user-flow regressions. Out of the executable subset, 54 tests passed, 17 failed, and 9 were blocked; the score is computed on the executable subset only and excludes blocked cases. The strongest areas are account/profile, staff console basics, and many vehicle browsing paths. The main stability issues cluster around subscription plan CRUD, rental booking handoff, and some catalog filters. Repeated failures in similar journeys suggest a few shared routing/state-management problems rather than isolated glitches, which lowers confidence in end-to-end reliability.

What could be better

The most consistent failures are in subscription plan management and booking handoff. Multiple tests report `Not Found` after creating or editing a subscription package, and deactivation/deletion also fail with `Không thể thay đổi trạng thái mở bán` / `Không thể xóa gói thuê bao này`. Several customer booking flows route to `/admin` instead of a customer checkout or rental-selection screen, which blocks checkout, long-term booking, and payment-history verification. Vehicle filters also appear unreliable: selecting `Ô tô điện` still leaves gasoline cars and motorcycles in the results. A separate scheduling issue shows created shifts saved with the wrong time range.

Recommendations

Prioritize the shared navigation and data-flow bugs first: fix the post-login routing so customer booking flows land in the intended checkout/rental screens instead of `/admin`, then verify subscription plan create/edit/deactivate/delete routes and success handling so they don’t return `Not Found`. Next, audit the vehicle catalog filters to ensure branch and category filters actually constrain the result set, and confirm schedule creation persists the exact entered time range. After each fix, re-run the related tests by title, especially the subscription plan CRUD cases, booking checkout cases, and vehicle filter tests, to confirm the regressions are gone.

Frontend UI Test Results

1 Test Coverage Summary

This report summarizes the frontend UI testing results for the application. TestSprite's AI agent automatically generated and executed tests based on the UI structure, user interaction flows, and visual components. The tests aimed to validate core functionalities, visual correctness, and responsiveness across different states.

CATEGORY	TEST CASES	PASS/FAIL RATE
Staff Operations Console	24	19 Pass / 5 Fail
Vehicle Showcase & Detail	14	7 Pass / 7 Fail
Billing & Payments	12	3 Pass / 2 Fail / 7 Blocked
Subscription Plans	14	4 Pass / 10 Fail
Account & Profile	16	15 Pass / 1 Fail
Rental Booking & Search	15	6 Pass / 7 Fail / 2 Blocked
Reservation Management	16	7 Pass / 7 Fail / 2 Blocked

Note

The test cases were generated using real-time analysis of the application's UI hierarchy and user flows. Some visual and functional validations were adapted dynamically based on runtime DOM changes.

2 Test Execution Summary

TEST CASE	TEST DESCRIPTION	IMPACT	STATUS

Staff Operations Console			
Update a department	Validate that staff can edit an existing department and save the changes.	High	PASSED
View and manage roles	Verifies staff can open the role management page and review role assignments in the organization.	Medium	PASSED
View the role management page	Validate that staff can open the role management page and review the current organization roles.	Medium	PASSED
View the branch list	Validate that staff can open the branches management page and review branch records.	Medium	PASSED
Filter maintenance records by vehicle and status	Verifies staff can narrow maintenance records using vehicle code and status filters.	High	FAILED
View admin dashboard metrics	Verifies staff can open the operations dashboard and see the core system metrics and shortcuts.	High	PASSED
Create and update a maintenance ticket	Verifies staff can create a maintenance record and continue to the update flow for an existing ticket.	High	PASSED
Look up a rental order	Validate that staff can search for a rental order from the rental lookup page and see its details.	High	PASSED
View the admin dashboard overview	Validate that staff can open the admin overview and see the main operational summary cards and management shortcuts.	High	PASSED
Create a new department	Validate that staff can add a new department from the departments management page.	High	PASSED
Look up a tax order	Validate that staff can search for a tax order number and view the retrieved order information.	High	FAILED
Filter maintenance records by vehicle and status	Validate that staff can search the maintenance list using vehicle code and status filters.	High	PASSED
View and manage departments	Verifies staff can open the departments list and access the create and edit flows from the organization structure page.	High	PASSED
Open the scheduling calendar	Validate that staff can open the schedule view to review existing vehicle assignments.	Medium	PASSED
View the staff list	Validate that staff can open the staff management page and review staff records.	Medium	PASSED
Create a driver schedule shift	Verifies staff can schedule a driver for a time range and create a shift successfully.	High	FAILED
Update an existing maintenance record	Validate that staff can open an existing maintenance ticket and update its details.	High	PASSED
Create a maintenance ticket	Validate that staff can start a new maintenance record from the maintenance management page.	High	PASSED
Review role assignments from the profile page	Validate that staff can open the profile area and review the roles assigned to a staff member.	Medium	PASSED
Look up a rental order	Verifies staff can retrieve rental information by entering a rental order code.	High	PASSED
View the departments list	Validate that staff can open the departments management page and see the organization departments.	Medium	PASSED
Open vehicle management from the dashboard	Verifies staff can move from the admin dashboard into vehicle management through the system shortcuts.	Medium	PASSED
Look up a tax order	Verifies staff can retrieve tax order information using the tax order code search flow.	Medium	FAILED
Create a driver schedule	Validate that staff can assign a driver and create a vehicle schedule for a valid date and time range.	High	FAILED

Vehicle Showcase & Detail			
Review vehicle showcase highlights and featured offers	Verify a public user can view featured vehicle highlights and promotional showcase content on the homepage.	Low	PASSED
Use branch and location controls to refine vehicle browsing	Verify a public user can change branch or location context and continue browsing vehicles.	Medium	FAILED
Browse vehicle catalog and open a vehicle detail view	Validate that a public user can browse the vehicle showcase and open a vehicle-specific detail page from the catalog.	High	PASSED
Browse the vehicle catalog	Verify a public user can browse the vehicle catalog and view available vehicles.	High	PASSED
Open a vehicle detail page from the catalog	Verify a public user can open a vehicle detail view from the catalog and review the vehicle information.	High	PASSED
Review pricing and booking details on a vehicle page	Verify a public user can inspect rental pricing and booking-related information on a vehicle detail page.	High	PASSED
Filter vehicles by category	Verify a public user can filter the catalog to see only vehicles from a selected category.	High	FAILED
Filter vehicles by category in the catalog	Validate that a public user can filter the vehicle catalog by type and see only matching vehicles.	Medium	FAILED
Open a vehicle detail page from a featured vehicle card	Validate that a public user can access a vehicle-specific detail view from a featured vehicle section on the homepage.	High	FAILED
Browse from homepage hero to the vehicle catalog	Validate that a public user can move from the homepage hero area to the vehicle catalog and see the available showcase vehicles.	Medium	PASSED
Inspect vehicle images and gallery on the detail page	Verify a public user can view the vehicle image set from a vehicle detail page.	Medium	FAILED
Use the interactive 3D vehicle showcase	Validate that a public user can interact with the 3D vehicle showcase and view the featured vehicle presentation.	High	FAILED
View a vehicle in the interactive showcase	Verify a public user can open and inspect a featured vehicle in the interactive showcase area.	High	FAILED
View details for a specific vehicle type from the showcase	Validate that a public user can open a detail view from a vehicle type card and see the corresponding vehicle information.	Medium	PASSED

Billing & Payments			
Review subscription package pricing details	Validates that an admin can open the subscription package management area and inspect pricing used for rental billing plans.	Medium	PASSED
Search a rental record from the staff portal	Validates that staff can look up a rental by code and view its payment-related status in the admin portal.	Medium	PASSED
Complete checkout for a rental booking	Validates that a customer can proceed through rental checkout and complete payment successfully.	High	FAILED
View customer payment history	Validates that a customer can open their payment history and review past rental payments.	High	BLOCKED
View customer payment history	Validates that a customer can open and review their rental payment history.	High	BLOCKED
Open rental invoice details	Validates that a customer can open an invoice and review its billing details.	High	BLOCKED
Review admin revenue summary	Validates that an admin can open the dashboard and review the overall revenue summary used for billing oversight.	Medium	PASSED
Create a rental policy with VAT, late fee, and deposit	Validates that an admin can create a rental policy configuration used to calculate checkout charges.	High	FAILED
Access billing details from a completed rental	Validates that a customer can open billing details from a completed rental record.	Medium	BLOCKED
Review checkout total before payment	Validates that a customer can review the final rental charges before completing payment.	Medium	BLOCKED
Complete hourly rental checkout and payment	Validates that a customer can select a specific car for an hourly rental, proceed through checkout, and complete payment successfully.	High	BLOCKED
View invoice details for a rental payment	Validates that a customer can open an invoice from payment history and inspect the invoice details for a rental.	High	BLOCKED

Subscription Plans			
Deactivate a subscription plan	Verify an administrator can change a subscription package to a non-active state from the plans list.	Medium	FAILED
Browse subscription packages from the home page	Verify a customer can reach the subscription package section from the public homepage and view available plans.	High	PASSED
View subscription plans list	Verify the subscription plans page displays the existing package list for management.	High	PASSED
Create a new subscription package	Verify an authenticated staff user can add a new subscription package and see it appear in the package list.	High	FAILED
Edit an existing subscription plan	Verify an administrator can update an existing subscription package from the plans list.	High	FAILED
Open subscription package management from the admin dashboard	Verify an authenticated staff user can navigate from the admin dashboard to the subscription package management page.	High	PASSED
View a specific plan from the customer pricing section	Verify a customer can inspect a specific subscription plan card and continue toward rental selection.	High	FAILED
Create a new subscription plan	Verify an administrator can add a new subscription package from the plans page.	High	FAILED
Deactivate a subscription package	Verify an authenticated staff user can change a package status so it is no longer active in the list.	Medium	FAILED
Delete a subscription plan	Verify an administrator can remove a subscription package from the plans list.	Medium	FAILED
View subscription package details with a chosen vehicle type context	Verify a customer can compare plans while browsing a specific vehicle type and see relevant package options for that use case.	Low	PASSED
Delete a subscription package	Verify an authenticated staff user can remove a subscription package from management.	Medium	FAILED
Edit an existing subscription package	Verify an authenticated staff user can update an existing subscription package and see the revised details in the list.	Medium	FAILED
Start a long-term rental from the homepage	Verify a customer can choose the long-term rental path from the homepage and reach the rental flow for selecting a vehicle or plan.	High	FAILED

Account & Profile			
Toggle password visibility during registration	Verify a user can reveal and hide the password while creating a new account.	Medium	PASSED
Start account registration from the home page	Verify a new user can reach the registration form from the public home page and begin account creation.	High	PASSED
Open the login page from the home screen	Verify a visitor can reach the sign-in form from the public home page.	High	PASSED
Register a new account with the form manually filled	Verify a new user can complete the initial registration form without using the quick-fill shortcut.	High	PASSED
Use the registration form auto-fill shortcut	Verify the registration page can be populated through the quick-fill entry point for new account creation.	High	PASSED
Complete registration with visible password entry	Verify a new user can fill the sign-up form, reveal the password, and proceed to the next step of account creation.	High	PASSED
Open my profile from the staff dashboard	Verify a logged-in user can access their profile details from the main staff dashboard.	High	PASSED
Open the login page from the public home page	Verify a visitor can navigate from the home page to the login page to access an existing account.	High	PASSED
Open the forgot password entry point from sign in	Verify a user can access the password recovery flow entry point from the login page.	High	PASSED
Open role management from the dashboard	Verify an authenticated staff user can navigate from the dashboard to the role management page and see assigned roles.	High	PASSED
View my profile details	Verify an authenticated user can open their profile page and review personal account details.	High	PASSED
Complete the first registration step	Verify a new user can complete the registration information step and proceed to OTP verification entry.	High	FAILED
Access password recovery entry from the login page	Verify a user can reach the password recovery entry point from the login screen.	Medium	PASSED
Open customer sign-in from the home page	Verify a visitor can choose the customer access path and reach the login page from the public home page.	Medium	PASSED
Return to sign in from the registration page	Verify a user can switch from account creation to the login entry point.	Low	PASSED
View profile from the staff role page	Verify a logged-in user can reach their own profile details from another authenticated staff page.	Medium	PASSED

Rental Booking & Search			
View vehicle details before booking	Verify a customer can open a vehicle detail view from the catalog and inspect key rental information before proceeding.	Medium	PASSED
Book an hourly rental for a specific car	Validates that a customer can complete an hourly rental booking for a chosen vehicle with trip details entered end to end.	High	FAILED
Complete a rental with payment at checkout	Validates that a customer can review pricing and finish a rental booking through the payment step.	High	PASSED
Search vehicles and open a rental listing	Validates that a customer can search the fleet, review a vehicle, and open its rental flow from the discovery experience.	High	PASSED
Book a long-term rental plan	Validates that a customer can choose a long-term rental option and complete the booking flow using an available subscription plan.	High	BLOCKED
Search vehicles by branch and type	Validates that a customer can narrow the catalog using branch and vehicle type filters and see matching results only.	Medium	FAILED
Browse the vehicle catalog and inspect a card's details	Validates that a customer can browse the catalog and view the key details of a vehicle before starting a booking.	Medium	PASSED
Open the customer login entry from the rental site	Validates that a customer can reach the login entry point from the rental experience before booking.	Low	PASSED
View and choose a subscription package from the rental page	Validates that a customer can inspect the available rental packages and open one for booking.	Medium	FAILED
Search and filter available rental vehicles	Verify a customer can search the vehicle catalog and narrow results by rental type and branch context.	High	FAILED
Start a booking from the interactive vehicle showcase	Validates that a customer can use the interactive showcase to choose a vehicle and move into the rental flow.	Medium	FAILED
Browse subscription packages for long-term rentals	Verify a customer can inspect available long-term rental subscription packages and choose one to proceed.	Medium	FAILED
Set up an hourly rental trip	Verify a customer can configure an hourly rental by choosing a pickup and return schedule from the trip setup widget.	High	FAILED
Complete a rental booking from the homepage	Verify a customer can move from discovery to booking confirmation for an available rental vehicle.	High	PASSED
Start a long-term rental booking flow	Verify a customer can switch to the long-term rental flow and begin booking a subscription-style rental package.	High	BLOCKED

Reservation Management			
Review subscription plans for a long-term reservation	Validates that a customer can inspect the available subscription plans before choosing a long-term rental option.	Medium	PASSED
Check reservation management from the staff portal	Staff looks up a reservation in the management portal to review its current state.	High	PASSED
Review a vehicle detail page before booking	Validates that a customer can open a car detail page, review its information, and proceed toward booking.	High	FAILED
Filter maintenance reservations by vehicle and status	Validates that staff can filter the reservation or maintenance list by vehicle code and status to find the correct record.	Medium	FAILED
View a reservation in the staff portal	Validates that staff can look up an existing reservation using its code and view the reservation record.	High	PASSED
Create a maintenance record for a rented vehicle	Validates that staff can start creating a maintenance record from the management area for a vehicle involved in a rental lifecycle.	Medium	PASSED
Browse available vehicles from the booking flow	Customer starts a booking and reviews the vehicle selection experience.	High	PASSED
Use a subscription package during booking	Customer selects a subscription package as part of the rental lifecycle.	Medium	FAILED
Review active rental policies before booking	Validates that a customer or staff user can open the rental policy page and review the current policy options that affect reservation pricing.	Low	FAILED
Assign a driver to a rental schedule	Validates that staff can create a vehicle usage schedule and assign a driver for an upcoming rental period.	Medium	BLOCKED
Start a hourly rental booking from the homepage	Validates that a customer can begin a short-term booking flow from the public homepage and reach the rental configuration area.	High	BLOCKED
View reservation details	Customer checks the status of an existing reservation after starting a booking.	High	PASSED
Filter vehicles and open a specific vehicle booking	Validates that a customer can narrow the vehicle list and open a specific car's booking flow.	High	PASSED
Start a long-term rental booking	Customer begins a long-term booking and reaches the next step with selected rental information.	High	FAILED
Start a long-term rental booking from the homepage	Validates that a customer can begin a long-term booking flow from the public homepage and reach the rental configuration area.	High	FAILED
View rental scheduling information	Customer reviews a planned rental schedule and timing details during the booking lifecycle.	Medium	FAILED

3 Test Execution Breakdown

Failed & Blocked Test Details

Use branch and location controls to refine vehicle browsing

ATTRIBUTES

Status	FAILED
Priority	Medium
Description	Verify a public user can change branch or location context and continue browsing vehicles.

```

Error

Sent keys: Enter

Cause

The failure on Enter suggests the deployed app likely did not respond to the keyboard event, most commonly because the production build is missing or breaking the Enter key handler, the target control was not focusable/focused in the hosted version, or a frontend runtime error/overlay prevented the key event from reaching the input/form. It can also happen if the host is serving an outdated or incorrect build that lacks the expected submit behavior.

Fix

Inspect the hosted frontend for keyboard-event handling on the relevant input/dialog. If Enter is supposed to submit a form or confirm an action, ensure the page has a proper <form> submit handler or an explicit onKeyDown/onKeyPress listener that calls the intended action for Enter. Also verify the deployed build is current, the input is focused when the test runs, and no overlay/modal intercepts keyboard events. If this is a hosting/environment issue, check that the correct production bundle is being served and that no minification/runtime error prevents the key handler from attaching.

Deactivate a subscription plan

ATTRIBUTES

Status	FAILED
Priority	Medium
Description	Verify an administrator can change a subscription package to a non-active state from the plans list.

Error

TEST FAILURE The active subscription package could not be changed to an inactive state. The page displayed an error, and the package remained active. Observations: - “Gói Trải Nghiệm Khởi Đầu” was shown as “Đang bán.” - After selecting “Ngừng bán,” the page showed “Không thể thay đổi trạng thái mở bán.”

Cause

The hosting-side backend is likely rejecting the status change request for the subscription package because the deployed service has a bug or stale configuration that blocks changing an active package to inactive. This could be caused by an outdated production deployment, incorrect environment variables, missing database update permission, or server-side validation/business logic that incorrectly disallows the ‘Ngừng bán’ state transition and returns ‘Không thể thay đổi trạng thái mở bán.’

Fix

Check the production API/hosting backend for the package status update endpoint and any authorization/business-rule validation that rejects transitions from active/selling to inactive/stopped. Most likely the host is still running an outdated build or misconfigured environment variable/feature flag that forces the update to fail, or the backend allows only one direction of state change. Deploy the correct version, verify the database write/update permission, and ensure the endpoint accepts the ‘Ngừng bán’ status and persists it properly. If there is a proxy/serverless function, also confirm it is not returning a generic error due to a missing route, failed CORS/auth token, or stale cached response.

Complete checkout for a rental booking

Error

Test failed at step 13 (click) — Try opening rental options from the Porsche Taycan 4S vehicle card as an alternative route to checkout. Error: Failed to click element 4185: Event handler browser_use.browser.watchdog_base.DefaultActionWatchdog.on_ClickElementEvent#3712(?▶ ClickElementEvent#f8f3 ⛹) timed out after 15.0s

Cause

The click on the Porsche Taycan 4S vehicle card likely did not complete because the page's click handler or the resulting UI transition is stalled on the hosting side. Common causes are a broken event listener, an overlay intercepting the click, a route/navigation that hangs due to a slow or failed backend request, or a production-only JavaScript error that blocks the action. Since the watchdog timed out rather than reporting a direct UI assertion failure, the most likely issue is that the click produced no responsive state change within the allowed time.

Fix

Inspect the Porsche Taycan 4S card click target and the downstream route it opens: ensure the card/button is actually clickable (no overlay, no disabled state, no pointer-events:none), and that the click does not trigger a blocked or long-running client-side operation. If the card opens a modal or navigates to a rental options page, make sure the handler resolves quickly and the UI is rendered without waiting on a hanging API call. Also verify any lazy-loaded images, animations, or scroll observers on the vehicle card aren't preventing the click event from completing in the hosted build.

Error

TEST FAILURE The maintenance filters did not show the matching record for vehicle code 1001 and status “Hoàn thành.” The results list was empty. Observations: - The selected filters were vehicle code 1001 and status “Hoàn thành.” - After clicking “Lọc danh sách,” the page showed “0 phiếu.” - The page displayed “Không có phiếu bảo trì phù hợp.”

Cause

The hosted service is likely filtering against mismatched values, causing the record to be excluded even though it exists. Common hosting-side causes include stale or incomplete seeded data in the deployed environment, a status text mismatch (e.g., accented Vietnamese label not matching the stored value or an internal enum/code value), or a type/whitespace mismatch for vehicle code 1001. As a result, the filter query returns no matches and the UI shows 0 phiếu / no maintenance records.

Fix

Review the maintenance-list filtering logic on the hosted app for the combination of vehicle code and Vietnamese status labels. Ensure the client/server filter compares against the exact stored values (including Unicode/diacritics and any normalized variants), and that vehicle code 1001 is matched as the same type/format (string vs number, leading zeros, whitespace). If data is fetched from an API, verify the backend query/seed data contains a maintenance record for vehicle 1001 with status “Hoàn thành” and that the deployed build is using the latest dataset/config. Add logging for the filter input and query result to confirm the record is returned before rendering.

Book an hourly rental for a specific car

ATTRIBUTES

Status	FAILED
Priority	High
Description	Validates that a customer can complete an hourly rental booking for a chosen vehicle with trip details entered end to end.

Error

Test failed at step 15 (click) — Select the Porsche Taycan 4S using its visible “Đặt xe” control to open the booking flow. Error: Failed to click element 5447: Event handler browser_use.browser.watchdog_base.DefaultActionWatchdog.on_ClickElementEvent#6976(?▶ ClickElementEvent#1e15 ⛹) timed out after 15.0s

Cause

The click on the Porsche Taycan 4S booking control likely triggers a host-side handler that does not complete within the 15s watchdog window. Common causes are a blocked/stalled network request, expensive synchronous rendering or state updates after click, an overlay or invisible element intercepting the event, or the button waiting on data before opening the booking flow. In short, the host app's click response is too slow or stuck, so the automation times out while waiting for the click action to finish.

Fix

Inspect the Porsche Taycan 4S card's visible "Đặt xe" button for a slow or blocked click handler on the host app. Likely fixes include removing any overlay or loading layer intercepting the click, ensuring the button is not disabled until after async data finishes loading, reducing heavy synchronous work in the click path, and verifying the booking modal/navigation is opened via a fast client-side route change. Also check for API calls triggered on click that may hang; add timeouts/fallback UI and make the action responsive immediately while fetching data in the background.

Create a new subscription package

ATTRIBUTES

Status	FAILED
Priority	High
Description	Verify an authenticated staff user can add a new subscription package and see it appear in the package list.

Error

TEST FAILURE The new subscription package could not be added. Submitting the form displayed “Not Found,” and the package did not appear in the list. Observations: - The creation form remained open after submission. - The package list still showed the four pre-existing packages.

Cause

The most likely hosting-side issue is a broken or missing route for creating a subscription package in production. The form submit is probably hitting a nonexistent endpoint or an incorrect relative path, so the server responds with 404 Not Found instead of processing the create request. Because the submission fails, the modal stays open and the new package never appears in the list.

Fix

Check the form submission endpoint configured on the hosting side. The browser is likely POSTing to a route that does not exist in the deployed app (causing the host to return a 404/"Not Found"). Verify that the add-package API/server action path matches the frontend form action, and that the backend route is actually deployed and reachable on the same domain. If this is a SPA/static deployment, ensure the app either sends the request to the correct API base URL or rewrites the submission route to the proper handler. Also confirm that the production build includes the latest backend/API code and that any Cloudflare/hosting routing rules are not stripping or misrouting the POST request.

Filter vehicles by category

```

Error

TEST FAILURE Selecting “Ô tô điện” did not limit the catalog to electric cars. Gasoline cars and motorcycles remained in the results. Observations: - The active filter indicator showed “Phân khúc: Ô tô điện”. - The catalog still reported “Tìm thấy 15 xe”. - Visible cards included “Ô tô xăng” and “Xe máy” as well as “Ô tô điện”.

Cause

The most probable cause is a broken or incomplete filter implementation on the hosting side: the selected segment is reflected in the UI, but the actual dataset is not filtered by segment before rendering. This could be due to a stale build/deployment, a frontend bug where the segment filter is not wired into the search/filter predicate, a mismatch between display labels and internal category values, or an API/edge response that ignores the segment parameter and always returns the full catalog.

Fix

Likely the segment filter UI is only updating the active label/state, but the catalog query/render pipeline is not actually applying the selected segment as a filter. Check the hosted frontend's filter logic and data mapping: ensure the segment key for "Ô tô điện" matches the vehicle data field values exactly, and that the catalog list is recomputed from the filtered subset rather than the full dataset. If the app uses client-side state, verify the filter function includes segment in its predicate and that state updates trigger a re-render. If the data comes from an API or edge function, ensure the request includes the segment parameter and the backend respects it. Also inspect any normalization/i18n mismatch (e.g., "Ô tô điện" vs "oto-dien" or different accent/case handling) and fix the mapping so electric cars only return electric cars, excluding gasoline cars and motorcycles.

Error

TEST FAILURE The staff dashboard does not provide a tax-order lookup function, so a tax order number could not be searched and order information could not be displayed. Observations: - The staff dashboard function catalog search for “thuế” showed “Không tìm thấy chức năng phù hợp.” - The search showed zero matching functions; the dashboard lists 19 functions overall.

Cause

The hosted frontend appears to be missing the tax-order lookup feature in the staff dashboard, or the feature is present in code but not exposed due to a bad deployment/configuration issue (for example, omitted route, incorrect feature registration in the function catalog, or broken i18n/search metadata). As a result, searching for “thuế” returns no matching function and staff cannot search by tax order number or display order information.

Fix

Add or restore a staff-dashboard feature for tax invoice/order lookup (e.g., a search field or dedicated module that can query orders by tax order number and display order details), and ensure the function catalog/route includes Vietnamese keywords like “thuế” and related labels so it becomes searchable. If this was intended but missing due to a deployment issue, redeploy the frontend/backend with the correct component bundle, route mapping, and API integration for tax-order retrieval.

Error

TEST BLOCKED The customer payment-history check could not be completed — the provided credentials opened an administrator account and staff profile, not a customer portal. Observations: - The profile page identifies the signed-in role as “Quản trị viên” (administrator). - The visible account and navigation options did not show customer payment history. - No past payment entries or completed/processed statuses were available to review.

Cause

The hosted service appears to have an account/role configuration issue: the credentials used by the test are being authenticated against an administrator/staff user instead of a customer user. This could be caused by wrong seeded data in the deployed environment, a mistaken user-role association in the database, duplicated credentials across roles, or a misconfigured auth API/environment variable causing the app to route the session into the admin portal. As a result, the payment-history page is not accessible because the login lands on an admin profile that does not expose customer payment records.

Fix

Verify the hosting/deployment environment is serving the correct authentication data for the payment-history test account. Update or reseed the production/staging database and account mapping so the provided customer credentials resolve to a customer-role user, not an administrator/staff account. Check for duplicate usernames/emails across roles, stale seed data, misconfigured auth backend or environment variables, and role-based redirects/guards that may be forcing admin login. If needed, create a dedicated customer test account and ensure the frontend/backend session payload, JWT claims, and profile/route authorization all reflect the customer portal after sign-in.

Review a vehicle detail page before booking

ATTRIBUTES

Status	FAILED
Priority	High
Description	Validates that a customer can open a car detail page, review its information, and proceed toward booking.

```

Error

TEST FAILURE The selected vehicle’s booking flow did not appear after login. The browser opened the operations admin dashboard instead. Observations: - The vehicle detail page offered “Tiến hành đặt xe.” - Continuing to book led to the login screen. - After login, the current page was the operations dashboard at /admin, not a booking flow.

Cause

The hosting-side app likely has a misconfigured authentication redirect or role-based route guard that sends every authenticated session to the admin dashboard (/admin) as the default landing page. In the booking flow, the app appears to lose the original destination when redirecting to login, so after login it falls back to the default dashboard instead of restoring the vehicle booking flow. This can also happen if the deployed build is using the wrong post-login callback configuration or an outdated frontend bundle with incorrect redirect behavior.

Fix

Adjust the post-login redirect logic to preserve the original booking intent. When an unauthenticated user clicks “Tiến hành đặt xe”, store the intended booking route/state (e.g., via returnUrl, router state, or session storage) and, after successful authentication, send non-admin users back to the vehicle booking flow instead of the default /admin landing page. Also verify role-based routing so customers are not routed to the operations dashboard by default. If the hosting deployment bundles a stale frontend build or misconfigured auth callback environment variables, redeploy the correct build and confirm the login callback URL/redirect targets are pointing to the booking page path.

137
138   asyncio.run(run_test())
139
```

Error

TEST FAILURE The subscription package changes were not saved. A “Not Found” message appeared, and the plans list continued to show the original package details. Observations: - The page displayed a “Not Found” notification after “Cập nhật gói” was clicked. - The edit drawer remained open. - The list still showed “Gói Trải Nghiệm Khởi Đầu” at 990.000đ, 30 days, and 12 hours.

Cause

The hosting side likely has a broken or mismatched backend route for saving subscription package edits. When "Cập nhật gói" is clicked, the app appears to request a non-existent endpoint or incorrect path, resulting in a 404 Not Found response. Because the update never reaches a valid handler, the drawer stays open and the plan list remains unchanged.

Fix

Likely the edit form is submitting to a wrong/missing API route on the hosted environment (e.g. the deployed frontend is pointing to an outdated backend URL or the update endpoint is not implemented on the worker), causing a 404 Not Found and preventing the package changes from persisting. Fix by verifying the production API base URL and routing, ensuring the update subscription package endpoint exists and accepts the expected method/payload, and redeploying the frontend/backend so the edit action calls the correct service and refreshes the list after a successful save.

asyncio.run(run_test())

```

Error

TEST BLOCKED The customer payment-history view could not be reached. The supplied credentials opened an administrator employee profile, so past customer payment records and rental transaction details could not be verified. Observations: - The profile labels the signed-in role as “Quản trị viên.” - Searching the operations function catalog for “thanh toán” showed “Không tìm thấy chức năng phù hợp.”

Cause

Khả năng cao trên hosting đang có cấu hình sai hoặc dữ liệu tài khoản mẫu bị lệch khiến credentials của bài test đăng nhập nhầm vào tài khoản nhân viên/quản trị viên thay vì tài khoản khách hàng. Điều này làm giao diện chỉ hiển thị profile 'Quản trị viên' và không có chức năng 'thanh toán', nên trang payment-history của customer không thể truy cập để kiểm tra lịch sử giao dịch.

Fix

Tách và kiểm tra lại luồng đăng nhập/phân quyền trên hosting để đảm bảo bộ tài khoản test của khách hàng được map đúng sang vai trò customer thay vì admin/employee. Cụ thể: xác minh biến môi trường hoặc dữ liệu seed của tài khoản dùng trong test, sửa rule RBAC/route guard để không tự động đẩy user vào profile Quản trị viên khi thiếu hoặc sai role, và khôi phục/hiển thị đúng chức năng thanh toán/lịch sử thanh toán cho customer trong menu nghiệp vụ. Nếu cần, re-deploy lại front-end với cấu hình API/auth đúng và cập nhật dữ liệu mẫu để chức năng 'thanh toán' khả dụng.

Error

TEST FAILURE The shift was created for Lê Thị Lái, but the schedule shows a different time range from the one entered. Observations: - The new scheduled shift appears for Lê Thị Lái. - The entered range was 23/10/2026 09:00–17:00. - The schedule displays 23/10/2026 16:00–24/10/2026 00:00.

Cause

The most likely hosting-side issue is a timezone conversion mismatch or double conversion between the submitted local time and the stored/rendered time. The entered 23/10/2026 09:00–17:00 was displayed as 16:00–24/10/2026 00:00, which strongly suggests the backend/frontend is interpreting the shift in a different timezone (likely UTC vs local timezone) or applying an offset twice. Another possible cause is date-time parsing of DD/MM/YYYY in the deployed environment using a default timezone/locale different from the one used in testing, causing the times to shift by several hours and the end time to roll over to the next day.

Fix

Normalize shift timestamps consistently on the backend and frontend. Store and transmit scheduled times in UTC (or a single agreed business timezone) as full datetime values, not date-only or locale-parsed strings. When rendering the schedule, convert from the stored timezone to the user's display timezone without applying the offset twice. Also verify the form submission and API response mapping for start/end fields to ensure 09:00–17:00 is not being transformed into 16:00–00:00 by a timezone conversion bug, server-side parsing issue, or incorrect day-boundary handling.

Filter maintenance reservations by vehicle and status

```

Error

TEST FAILURE The filtered maintenance list did not include a matching entry for vehicle code 8 with status “Đang bảo trì.” Observations: - The page showed “0 phiếu” after the filters were applied. - The list displayed “Không có phiếu bảo trì phù hợp.”

Cause

The hosted app is likely not receiving or interpreting the maintenance record correctly in production: either the data for vehicle code 8 is missing from the deployed backend/mock dataset, or the filter logic is mismatched (for example, comparing 'Đang bảo trì' against a different stored status value, whitespace/encoding issue, or numeric/string vehicle code mismatch). As a result, the filter returns zero items and shows 'Không có phiếu bảo trì phù hợp.'

Fix

Check the maintenance list filtering logic on the hosting/build output: the filter for vehicle code 8 and status 'Đang bảo trì' is likely comparing against the wrong field, using an exact/case-sensitive/mismatched value, or not loading the expected data set in production. Verify the API response or seeded data actually contains a record for vehicle code 8 with that status, and ensure the frontend filter uses the same normalized status string and vehicle code type as the data source. If the page is using client-side filtering, inspect environment variables and deployed JSON/mock data; if using server-side filtering, fix the query or status mapping so the matching record is returned.

View a specific plan from the customer pricing section

```

Error

TEST FAILURE The selected subscription plan displayed its usage duration and price, but continuing through “Sở hữu thẻ” and login led to the admin dashboard instead of a rental-selection screen. Observations: - The “Gói Doanh Nghiệp & Đường Dài 100 giờ” plan showed 100 hours, 90-day validity, and a price of 90.000 ₫. - After login, the page displayed the Thong Dong operations dashboard. - No rental-selection screen was displayed.

Cause

The hosting-side app likely has a misconfigured authentication redirect or role-based routing issue: after login it is sending all authenticated users to the default Thong Dong admin dashboard. The subscription purchase flow appears to complete correctly up to login, but the app does not preserve the intended customer journey and routes the user to an admin-only landing page instead of the rental-selection screen.

Fix

Adjust the post-login redirect/route guards on the hosting app so that users coming from the subscription purchase flow are sent to the rental-selection page instead of the default admin dashboard. This may require separating customer and admin roles, ensuring the login session includes the correct customer context, and updating the router/redirect logic after successful authentication to land on the rental selection screen for subscription buyers.

Error

TEST BLOCKED Invoice details could not be verified — signing in with the supplied customer credentials opened the operations dashboard, where no customer invoice list or invoice details were available. Observations: - The page opened at `/admin` and displayed the Transit Desk operations dashboard. - The visible dashboard contained no customer invoice section or rental billing details.

Cause

The hosted app likely has a role-mapping or route-guard misconfiguration: the supplied customer login is being authenticated as an admin/operations user, or the deployment is defaulting all authenticated sessions to /admin. Another possible hosting-side issue is that the customer invoice module was not deployed or is disabled in the current build, so the only available post-login UI is the Transit Desk dashboard and no invoice list/details are rendered.

Fix

Check the authentication/role-routing logic on the hosting side so that customer accounts are not being sent to the /admin operations dashboard. Customer credentials should resolve to a customer-facing area with invoice/billing routes, and admin-only pages should be protected by role checks. Also verify the deployed frontend build and environment data/feature flags are pointing to the correct customer invoice API or static route, since the current deployment appears to expose only the operations dashboard for the supplied login.

Create a new subscription plan

ATTRIBUTES

Status	FAILED
Priority	High

```

Error

TEST FAILURE The subscription package was not created. After submission, the page displayed “Not Found” instead of a success confirmation. Observations: - The “Not Found” notification appeared after submission. - The add-package form remained open. - The list still showed the four existing packages; the new package was not listed.

Cause

The submission likely hits a missing or misconfigured route on the hosted app, causing a 404 Not Found when creating the package. This can happen if the frontend is pointing to an incorrect API endpoint, the backend create-package route was not deployed, or the hosting platform lacks a rewrite/proxy rule for that POST request. As a result, the form stays open and the new package is never saved or listed.

Fix

Check the add-package form submission endpoint and deployment routing on the hosting side. The form is likely posting to a relative or incorrect URL that the host does not route to the backend/API, resulting in a 404 Not Found. Fix by updating the form/action or client request to the correct API path, ensuring the corresponding backend route exists and is deployed, and verifying the host rewrites/proxy rules so POST requests to the package-creation endpoint are forwarded correctly. Also confirm the backend handler returns a success response and that any serverless function/worker binding or environment config is present in production.

Complete the first registration step

```

Error

TEST FAILURE Registration did not proceed to OTP verification. The completed form remained on the registration information step after submission. Observations: - The page continued to display “Vui lòng chờ trước khi gửi lại OTP.” - The OTP entry form was not displayed.

Cause

The hosting-side service likely failed to complete the registration submit flow because the OTP generation/dispatch step did not succeed or the frontend never received the expected success response, so it stayed on the registration step and kept showing the resend cooldown message. A common cause is misconfigured backend environment variables or API endpoint mapping on the deployed host, or a bug where the OTP cooldown/session flag is set prematurely and blocks the transition to the OTP screen.

Fix

Check the registration-submit backend/OTP workflow on the hosting side: ensure the API call that creates the account and triggers OTP generation returns success, that any rate-limit/cooldown logic is not incorrectly applied on first submission, and that the frontend state transition to the OTP step is triggered on successful response. If the app is serverless, verify environment variables for OTP/email/SMS providers, CORS/API base URLs, and that no stale cached build is serving an outdated form state. Redeploy with the correct backend endpoint wiring and clear any cooldown/session state bug so the UI moves from registration to OTP verification immediately after a valid submit.

77
78    asyncio.run(run_test())
79
```

Error

TEST FAILURE The vehicle catalog remains populated after selecting “Ô tô điện,” but it does not show only matching vehicles.

Observations: - The selected filter is shown as “Phân khúc: Ô tô điện.” - The catalog still reports “Tìm thấy 15 xe.” - Results include a Toyota Corolla Cross labeled “Ô tô xăng” and motorcycles.

Cause

The likely issue is a broken or mismatched catalog filter implementation on the hosting side: the UI shows the selected segment, but the underlying filter logic is not narrowing the dataset. This can happen if the filter handler updates only the visible label, if the selected value does not match the data field values used by the catalog, if the fetch/query parameters are ignored, or if the results are being rendered from a cached/unfiltered list. The fact that non-electric cars and motorcycles remain visible suggests the filter is either not applied at all or is applied against the wrong field/source.

Fix

Fix the host-side filtering logic so the selected segment is actually applied to the catalog data before rendering. Specifically, verify that the "Ô tô điện" option maps to the correct internal filter key/value, and that the UI state change triggers a fresh filtered query or an in-memory filter on the full vehicle list instead of leaving the previous unfiltered list intact. Also ensure the product cards are filtered by the same field used by the labels (e.g., segment/category), not by a stale or mismatched property, and that the results count is recalculated after filtering.

Error

TEST BLOCKED The booking flow could not be completed because signing in with the provided account opened the operations dashboard instead of the customer booking flow. Vehicle selection, rental-date selection, booking submission, and booking confirmation could not be reached. Observations: - The page after sign-in was the “Thong Dong — Hệ Thống Thuê Xe” operations dashboard at `/admin`. - The dashboard showed operations navigation and service metrics, with no customer booking controls visible.

Cause

The hosted app is likely routing authenticated users to the admin/operations dashboard based on the account's role, session claim, or a faulty default redirect. In production, the provided test account appears to be recognized as staff/admin (or missing a customer-role indicator), so sign-in lands on /admin instead of the customer booking flow. This blocks the booking sequence because the customer-facing booking pages are not being shown for that account.

Fix

Check the production hosting/auth routing configuration so the test account is treated as a customer account, not an admin/staff account. Common fixes: ensure the seeded/login user used by the test has the correct role/claims (customer), adjust post-login redirect logic to send customer users to the booking flow instead of /admin, and verify any middleware/guards do not default all authenticated sessions to the operations dashboard. If the same credentials are reused across environments, update the hosted environment's user seed or role mapping so the account expected by the test opens the customer booking pages.

```

Error

TEST FAILURE Selecting the featured Porsche Taycan 4S card opened a booking dialog instead of a vehicle detail view.

Observations: - The dialog was titled “Đặt xe Porsche Taycan 4S” - The dialog showed a vehicle image and rental choices

Cause

The hosted frontend likely has a miswired interaction for the featured Porsche Taycan 4S card, where the card's click event is bound to the booking flow rather than the vehicle detail view. This could be caused by a regression in the deployed JavaScript bundle, a copied component using the wrong handler, or a CMS/config entry for that featured card that incorrectly points to the booking dialog action.

Fix

Update the featured Porsche Taycan 4S card click behavior so it routes to the vehicle detail page/modal instead of the booking dialog. On the hosting side, this likely means fixing the frontend bundle or deployed configuration for that card: ensure its onClick handler points to the detail-view action, remove any shared/incorrect booking-dialog handler binding, and redeploy the corrected build. If this is driven by data/config, verify the featured vehicle metadata includes the correct action type/route for details and not booking.

Error

TEST FAILURE The new rental policy was not created. After submission, the page showed “Not Found,” and the policy did not appear in the list. Observations: - A “Not Found” notification appeared after submission. - The policy creation form remained open. - The visible list still showed the four existing policy versions.

Cause

The hosting side is likely missing or misrouting the create-policy endpoint in the deployed environment. The form submission is reaching a URL that the host cannot resolve, causing a 404/Not Found response, which leaves the modal open and prevents the new policy from being persisted or reflected in the list. This can happen due to an incorrect production API base URL, a missing backend route after deployment, or static hosting rules that do not forward the submit request to the worker/app handler.

Fix

Check the hosting/deployment routing for the rental policy create request. The “Not Found” after submit strongly suggests the frontend is posting to a missing/incorrect API endpoint or the deployed worker doesn’t include the backend route for creating a policy version. Verify the form action/JS fetch URL, method, and deployed environment base path, then ensure the worker/server handles the create POST route and returns the created policy so the list can refresh. If this is a SPA hosting issue, add rewrite/fallback rules so API or client-side routes are not sent to a 404 page by the host.

Error

TEST FAILURE The catalog did not show only vehicles matching the selected filters. With “Ô tô điện” and the Quận 1 branch selected, the results still included gasoline cars and a motorcycle. Observations: - The active filters were “Phân khúc: Ô tô điện” and “Trạm: 5”. - The page showed five results after the catalog finished updating. - Visible results included Toyota Corolla Cross 1.8V and Toyota Vios 1.5G (gasoline), plus Vinfast 01 (motorcycle).

Cause

The most likely cause is a bug in the filtering pipeline on the hosting side: the UI or API is not intersecting the selected filters correctly. Instead of restricting results to vehicles that match both the chosen segment and branch, it appears to be showing a broader cached or partially filtered dataset, allowing gasoline cars and even a motorcycle to remain in the final rendered catalog. This can happen if filter state updates are asynchronous and overwrite each other, if the branch filter is only applied to availability but not vehicle type, or if the service is reading from an unfiltered endpoint and filtering only in the client with stale state.

Fix

Investigate the catalog filtering implementation on the frontend/API integration. The service likely applies only one filter, merges results from multiple endpoints incorrectly, or uses a stale/unfiltered list when updating the UI after branch and vehicle-type selections. Ensure the catalog query combines both active filters (segment = "Ô tô điện" and branch = "Quận 1/Trạm 5") with AND logic, and that the rendered list is rebuilt from the filtered dataset only. Also verify that vehicle category mapping is correct so motorcycles cannot appear in the car catalog when an automobile segment is selected. If the data comes from the backend, patch the search/filter endpoint to enforce the same constraints server-side and return only matching vehicles.

Error

TEST FAILURE The vehicle detail page shows only one vehicle image, so multiple images cannot be viewed or switched between. Observations: - The image viewer displays “1 / 1”. - No alternate images are available to select.

Cause

The hosted app is likely serving vehicle detail data with only one image available per vehicle, or the frontend is mapped to the wrong field (for example using a single `image` property instead of an `images[]` collection). This can happen if the production data/API response is incomplete, the build is pointing to stale mocked data, or a recent deployment stripped out additional gallery images, causing the viewer to display only “1 / 1” and preventing image switching.

Fix

Ensure the vehicle detail page receives and renders the full image gallery for a vehicle, not just a single thumbnail/main image. Check the backend/API or static hosting data for the detail endpoint to confirm it includes an array of image URLs (and not a single image field), and update the frontend image viewer/carousel to bind to that array so it can show multiple slides, thumbnails, and proper next/prev navigation. If the data source is incomplete, fix the seed/content/service worker/build artifact so each vehicle record contains multiple valid image URLs and deploy the updated assets.

Error

TEST FAILURE The package status could not be changed — the selected package remains active, and no success confirmation appeared. Observations: - The page showed “Không thể thay đổi trạng thái mở bán” (“Unable to change selling status”). - “Gói Trải Nghiệm Khởi Đầu” still showed “Đang bán” (active).

Cause

The most likely cause is a hosting-side backend problem where the status-change request for the package is failing before persistence, so the UI shows “Không thể thay đổi trạng thái mở bán” and the package remains active. This can happen if the deployed app is calling an incorrect API endpoint, missing required auth/CSRF headers, using stale environment configuration, or if the backend/database permissions prevent updating the package status. Another possibility is that the service is serving an old build or cached asset that still contains broken status-update logic.

Fix

Check the hosting/API backend implementation for the package sell-status update endpoint used by the admin UI. The failure suggests the UI request is either hitting a wrong/disabled route, returning an error from the server, or the database update is not persisting. Verify the deployed environment variables, API base URL, authentication/CSRF headers, and that the backend can actually update the package record (including any row-level security/policy rules if using a hosted DB). Inspect server logs for the exact error when toggling the status, then fix the endpoint to return success and persist the updated status, and redeploy the frontend if it is pointing to an outdated API URL or stale build.

    asyncio.run(run_test())

```

Error

TEST FAILURE The subscription package could not be deleted. “Gói Thử Nghiệm Nội Bộ” remains in the plans list. Observations: - The page displayed “Không thể xóa gói thuê bao này” (the subscription package could not be deleted). - “Gói Thử Nghiệm Nội Bộ” was still visible in the list after the deletion attempt.

Cause

The delete request for the subscription package is likely failing on the hosted backend, causing the frontend to show the error message and keep the item in the list. Common hosting-side causes are an incorrect API route/method after deployment, missing or invalid auth permissions, database foreign-key constraints because the plan is still referenced by other records, or a server error in the delete handler that prevents the record from being removed.

Fix

Check the delete subscription-package API on the hosting backend for authorization/constraint failures and ensure the frontend uses the correct delete endpoint/method with the package ID. If the package is referenced by active subscriptions or foreign-key constraints, either detach/soft-delete it first or implement proper cascade handling and return a clear success response so the UI can remove it from the list after refresh.

View and choose a subscription package from the rental page

Error

TEST FAILURE The selected rental package’s booking flow was not displayed. After sign-in, the page showed the operations dashboard instead. Observations: - Selecting “Sở hữu thẻ” opened a login page. - After sign-in, the page was at `/admin` and showed the operations dashboard. - No package booking flow was visible.

Cause

The hosted app appears to be redirecting any authenticated session to /admin by default, likely due to a misconfigured auth callback, role check, or route guard on the hosting side. As a result, selecting the package booking path opens the login page, but after sign-in the application sends the user to the operations dashboard instead of rendering the selected rental package booking flow.

Fix

Adjust the hosting/routing/auth redirection logic so the “Sở hữu thẻ” entry points to the customer/package-booking flow after login, not the admin dashboard. Check the route guard or post-login redirect (e.g., if the app defaults all authenticated users to /admin) and split roles so customer users are redirected to the booking/package page while admin users go to /admin. Also verify the deployed build/environment variables and route rewrites on the host are serving the correct frontend version for the booking flow.

Error

TEST BLOCKED The customer billing-details flow could not be verified — the provided account opened the operations dashboard, and the available completed-rental record was a staff operations view. Observations: - Rental #109 was marked “Hoàn tất” in the operations queue. - The record showed a contract total of 1,200,000 ₫, a deposit of 330,000 ₫, and VAT of 120,000 ₫. - No customer-facing billing-details view or invoice/payment summary was displayed.

Cause

The hosting-side app likely has a role/authorization or routing misconfiguration where the provided test account is being treated as staff/operations rather than customer, causing the completed rental record to resolve to an internal operations dashboard. This can happen if the account seed data has the wrong role, the frontend route guard defaults to the admin shell, or the deployed build is missing the customer billing-details page entirely.

Fix

Route the logged-in customer account to a customer-facing billing/details page instead of the staff operations dashboard. Check role-based access control, default post-login redirect, and any shared account/seed data used by the hosted test so the completed-rental record opens the customer invoice/payment summary view (with billing breakdown) rather than the operations queue. If the current deployment only exposes the staff UI, add or restore the customer billing-details route/component and ensure the completed rental #109 is linked to a customer invoice page.

Look up a tax order

ATTRIBUTES

Status	FAILED
Priority	Medium
Description	Verifies staff can retrieve tax order information using the tax order code search flow.

Error

TEST FAILURE Tax-order information could not be retrieved because the staff interface did not expose a tax-order code search. The available order lookup searched a rental order and displayed rental contract details instead. Observations: - Searches in the operations route finder for “thuế” and “hóa đơn” showed no matching function. - Searching rental order code 109 displayed its rental contract details, including a VAT amount, but no tax-order information.

Cause

The hosted application appears to expose only rental-order lookup in the staff/operations interface, with no implemented or wired tax-order/invoice search. The search function likely points to the rental contract endpoint or a generic order lookup, so entering order code 109 returns rental contract details (including VAT) instead of a distinct tax-order record. This suggests either a missing feature in the frontend navigation/route configuration, or an API/backend omission where tax-order search is not implemented or not connected to the staff interface.

Fix

Add a dedicated tax/invoice lookup path in the staff UI and backend API (e.g. search by tax-order/invoice code, not only rental order code), and ensure it returns tax-order details when queried. If the current route is reused for rental contracts, separate the data models/endpoints so searches for "thuế"/"hóa đơn" map to the correct tax-order functionality, then redeploy the frontend and confirm the staff interface exposes that search function.

Delete a subscription package

Error

TEST FAILURE The subscription package could not be removed. The page showed an error instead of a success confirmation, and the package remained in the list. Observations: - The page displayed “Không thể xóa gói thuê bao này” (unable to delete this subscription package). - “Gói Thử Nghiệm Nội Bộ” was still present in the package list.

Cause

The hosting-side service is likely returning an error from the delete request, causing the frontend to show “Không thể xóa gói thuê bao này” instead of success. This can happen if the delete API route is misconfigured on the deployed environment, the backend lacks permission/DB access, the record is protected by a foreign-key constraint or soft-delete rule, or the list is being repopulated from seeded/static data after deletion. As a result, the package remains visible in the list.

Fix

Check the hosting-side delete flow for the subscription package API/UI: verify the delete endpoint is not failing due to auth/CSRF/routing issues, and confirm the backend actually performs the delete and returns a success response. Also inspect whether the package is protected by a constraint (e.g., active references, soft-delete flag, or seed data reappearing on refresh). Fix the server logic so the package can be removed or, if it must be protected, ensure the UI only blocks deletion when the backend explicitly reports a valid dependency reason rather than a generic error.

Error

TEST FAILURE Selecting the subscription reached a payment checkout, but the requested booking summary and usage summary were not displayed. Observations: - The payment page showed a 90,000 VND amount. - The transfer description referenced “Goi Goi Doanh Nghiep Du.” - No booking summary or package usage summary was visible.

Cause

The hosted production build is likely serving an incomplete or misconfigured subscription checkout implementation. The payment page is successfully generating the transfer amount and description, but the booking summary and package usage summary are not appearing because the page is probably not receiving the required booking/subscription data from the client state or backend API. This can happen if an environment variable points to the wrong API, the checkout route is missing data hydration after navigation, the selected package data is not persisted across pages, or the production bundle differs from the tested local version.

Fix

Check the hosting/environment configuration and the frontend route/data source used for the subscription checkout page. The checkout flow is likely being rendered with only the payment amount and transfer memo, while the booking summary and usage summary depend on missing/failed API data, an incorrect production build, or a route/state hydration issue. Verify the deployed environment variables and backend endpoints for subscription/package details, ensure the payment page receives the selected booking/subscription context, and confirm the summary components are not hidden by CSS or omitted in the production bundle. Rebuild and redeploy the correct frontend assets after fixing the data binding or API integration.

Edit an existing subscription package

Error

TEST FAILURE Updating the subscription package did not succeed. The page displayed “Not Found,” and the package list continued to show the original details. Observations: - A “Not Found” notification appeared after submitting the edit. - The edit drawer remained open. - The list still showed “Gói Trải Nghiệm Khởi Đầu” at 990.000đ, 30 days, and 12 hours.

Cause

The update action likely resolves to a missing or incorrect route on the hosted production deployment, causing a 404/Not Found instead of processing the package update. This can happen if the frontend is calling the wrong API path, the backend route for updating subscription packages is not deployed or renamed, or the hosting platform lacks the proper rewrite rule for SPA navigation and API proxying. Because the save request failed, the drawer stayed open and the list remained unchanged.

Fix

Check the hosting/router configuration for the subscription-package edit/update flow and make sure the correct frontend route and backend API endpoint are deployed and reachable in production. The "Not Found" message strongly suggests the save action is hitting a missing path (for example, a client-side route not handled by the host, or an API URL that is wrong in the deployed environment). Verify the edit form submits to the intended PUT/PATCH endpoint, confirm any environment variables for API base URL are set correctly on the host, and ensure the serverless/SPA rewrite rules send non-file requests to the app entry point. After fixing the route/API mapping, redeploy so the update request actually persists and the list re-fetches the updated package data.

```

Error

TEST FAILURE The interactive 3D showcase is displayed, but the featured vehicle presentation did not update in response to the attempted interactions. Observations: - The showcase displayed the Porsche 911 Carrera 4S (2026), its 3D rendering, and vehicle specifications. - The Porsche 911 930 Turbo (1975), auto-rotation, and reset-view controls were visible. - Attempts to interact with the model selection and showcase controls timed out; no presentation update was verified.

Cause

The page is likely rendering the 3D showcase and vehicle details as static content, but the interactive state changes are failing on the client. This can happen if the JavaScript bundle responsible for the showcase does not load, hydration fails, or event handlers are broken, so clicks on model selection and showcase controls do not update the featured vehicle presentation. Another possible hosting-side issue is that the interaction logic depends on assets or API responses that are unavailable or misconfigured in production, causing the UI to appear functional while remaining non-interactive.

Fix

Verify that the model-selection and showcase controls are wired to live client-side event handlers and not just rendered as static UI. On the hosting side, check whether the required JavaScript bundle is loading successfully, hydrating correctly, and not being blocked by a runtime error, CSP, or asset path issue. Confirm that the featured vehicle state is stored and updated in the frontend app state and that clicking the Porsche 911 930 Turbo (1975), auto-rotation, or reset-view controls triggers a re-render of the 3D scene and vehicle specs. If the app is relying on SSR-only markup, move the interactive showcase into a client component, ensure the 3D engine initializes after hydration, and redeploy with corrected bundle references and error handling.

Create a driver schedule

ATTRIBUTES

Status	FAILED
Priority	High
Description	Validate that staff can assign a driver and create a vehicle schedule for a valid date and time range.

Error

TEST FAILURE The requested driver schedule was not created as entered. The schedule list does not show Trần Văn Tài’s October 25, 2026, 09:00–17:00 shift. Observations: - The shift form was submitted for Trần Văn Tài, 25/10/2026 09:00–17:00. - The visible list shows a Trần Văn Tài shift on 25/10/2026 16:00–26/10/2026 00:00 instead.

Cause

A likely hosting-side cause is inconsistent timezone handling in the deployed app/runtime: the schedule is being stored or rehydrated as UTC (or another timezone) while the UI expects local Vietnam time, causing the submitted 09:00–17:00 shift to appear as 16:00–00:00. This can happen if the frontend uses JavaScript Date objects without explicit timezone handling, if the backend/API serializes ISO timestamps and the client reinterprets them in a different timezone, or if the hosting environment's default timezone differs from the test's expected locale.

Fix

Inspect the driver schedule submission and display pipeline on the deployed frontend/service for timezone conversion or date normalization bugs. The entered local time 25/10/2026 09:00–17:00 may be getting transformed server-side or in client state to UTC or another timezone, producing 16:00–00:00 on the same/next day. Ensure the form saves and renders times in the intended local timezone consistently end-to-end: parse the input as local datetime, store either the original local values or a timezone-aware timestamp plus timezone, and render using the same timezone without implicit UTC shifting. Also verify any libraries or date formatting code are not auto-converting Date objects when serializing/deserializing.

Error

TEST FAILURE The rental policy entry does not display policy details or active rental conditions, so reservation pricing policies could not be reviewed. Observations: - The footer shows “Chính sách thuê & đặt cọc (10%)” and “Chính sách huỷ & hoàn cọc PayOS.” - The observed policy links lead to the `#chinh-sach` section. - The section displays policy labels but no policy details or active rental conditions.

Cause

The production site appears to have a broken or incomplete policy section implementation: the footer links point to #chinh-sach, but that section only shows policy headings/labels and not the actual policy details or active rental conditions. This is likely caused by missing deployed content, a frontend rendering bug, or a failed data fetch/conditional render on the hosting side, resulting in the reservation pricing policy information not being displayed.

Fix

Update the hosted front-end content/data for the #chinh-sach section so it renders the full rental policy text and active rental conditions, not just labels. Verify the policy links in the footer anchor to the correct section/component, and ensure any CMS/API/environment data used to populate policy details is deployed and returning content in production. If the policy content is conditionally hidden by CSS/JS, fix the rendering logic so the details are visible on page load and accessible to the tester.

Assign a driver to a rental schedule

ATTRIBUTES

Status	BLOCKED
Priority	Medium
Description	Validates that staff can create a vehicle usage schedule and assign a driver for an upcoming rental period.

Error

TEST BLOCKED The schedule could not be created or verified because the required pre-delivery inspection could not be saved. Observations: - The inspection form for rental #101 displayed “Forbidden” after submission. - The form remained open, and no schedule or assigned-driver time range was displayed.

Cause

The likely hosting-side cause is that the inspection save request is being rejected by the server with a 403 Forbidden response, indicating an authorization/permission or edge-protection issue rather than a UI problem. This could be due to missing/invalid credentials, a misconfigured Cloudflare Worker/API permission policy, blocked cross-origin credentials, or a backend rule that denies saving inspection data for the rental workflow, preventing the schedule and assigned-driver time range from being created or displayed.

Fix

Inspect the backend/API route that saves the pre-delivery inspection for rental #101 and remove/adjust the authorization or method restriction causing the 403. Common fixes include: ensuring the frontend sends the required auth token/session cookie, configuring CORS/Cloudflare Worker headers to allow the POST/PUT request, permitting the correct HTTP method on the inspection save endpoint, and verifying any WAF/route protection rules are not blocking the request. Also check that the inspection record can be persisted successfully in the database/storage, since the form staying open suggests the save call failed before schedule generation.

Review checkout total before payment

ATTRIBUTES

Status	BLOCKED
Priority	Medium
Description	Validates that a customer can review the final rental charges before completing payment.

191
192    asyncio.run(run_test())
193
```

Error

TEST BLOCKED The checkout charge summary could not be reached, so the rental total and payment due could not be verified. Observations: - Selecting “Tiến hành đặt xe” led to the operations dashboard instead of checkout. - The vehicle details showed an estimate of 660.000đ rental charge plus a 132.000đ refundable deposit, totaling 792.000đ; this was not a checkout summary.

Cause

The hosted production build appears to have a routing or redirect misconfiguration: the booking action button is navigating to an operations/admin dashboard route rather than the customer checkout route. This suggests an incorrect URL in the deployed frontend, a broken SPA route mapping, or a hosting rewrite/redirect rule overriding the intended checkout path. As a result, the test cannot reach the checkout summary and the rental total/payment due cannot be verified.

Fix

Update the checkout CTA routing on the hosting/deployment configuration so the “Tiến hành đặt xe” button points to the actual checkout page/route instead of the operations dashboard. Verify the client-side router/base path and any environment-specific redirects/rewrite rules in the deployed build so the production host serves the booking flow correctly. If a stale or misconfigured deployment is live, rebuild and redeploy with the correct route mappings and confirm the checkout summary page is reachable directly from the vehicle details flow.

Search and filter available rental vehicles

ATTRIBUTES

Status	FAILED

```

Error

TEST FAILURE The vehicle catalog does not provide a search field for a vehicle name or identifier. The hourly rental flow, selected Gò Vấp — Nguyễn Oanh branch, and electric-car filter were available; the filter showed matching vehicles with booking buttons, but catalog search could not be verified because the search control is absent. Observations: - The page-wide input check found only the “Chỉ xe có tài xế riêng” checkbox. - The “Ô tô điện” filter displayed VinFast VF 8 Plus and Porsche Taycan 4S. - Both vehicle cards showed a “Đặt xe” button.

Cause

The hosted frontend appears to be missing the vehicle catalog search control in the deployed build. The test could only find the “Chỉ xe có tài xế riêng” checkbox and other filters, which suggests the search UI was either never implemented, removed during a recent deployment, hidden by responsive/CSS logic, or not included in the production bundle on the hosting side.

Fix

Add a dedicated catalog search input to the vehicle listing UI (e.g. a text field for vehicle name/ID, with placeholder and accessible label such as “Tìm xe”/“Tìm theo tên hoặc mã xe”), wire it to the vehicle list filter logic, and ensure it is rendered on the main catalog page alongside the existing branch and fuel-type filters. If the feature already exists in code, check the hosting build/config to ensure the correct frontend bundle is deployed and not an older/stale version that omits the search component.

Start a hourly rental booking from the homepage

Error

TEST BLOCKED The booking flow could not be verified because attempts to choose a pickup branch and search for vehicles timed out. No vehicle results or rental configuration screen was reached. Observations: - The homepage showed “Thuê theo giờ” selected. - The pickup selector displayed “TP. Hồ Chí Minh (Tất cả chi nhánh).” - Attempts to select a branch and use “Tìm Xe” timed out; no results appeared.

Cause

The hosted service likely has a broken search flow in production: the pickup branch selector may be bound to unavailable data or a failing API call, and clicking "Tìm Xe" may be waiting on a request that never resolves. This can happen if the production API endpoint is down, misconfigured, blocked by CORS, or the frontend is built with incorrect environment variables, causing the branch selection/search to time out and preventing vehicle results from loading.

Fix

Verify the booking search UI wiring on the hosted build: ensure the pickup branch dropdown options are populated from the live API and are actually selectable, confirm the "Tìm Xe" button triggers a working search request, and check that the backend/API endpoint used for vehicle lookup is reachable from the production host (no CORS, auth, DNS, or environment-variable misconfiguration). Also inspect the frontend for any JS errors or infinite loading state that could block the branch selection/search flow. If the data source is failing, restore the API or provide fallback/static branch and vehicle data so the search results screen can render.

Complete hourly rental checkout and payment

ATTRIBUTES

Status	BLOCKED
Priority	High
Description	Validates that a customer can select a specific car for an hourly rental, proceed through checkout, and complete payment successfully.

```

Error

TEST BLOCKED The hourly rental was selected and the booking flow reached login, but submitting the provided credentials opened an operations dashboard rather than customer checkout. Payment and a completed rental transaction could not be verified. Observations: - The selected hourly rental was a Honda CR-V L 1.5 Turbo for November 3–4, 2026. - After login, the page showed the “Nhân sự vận hành” operations dashboard. - No customer payment form, booking confirmation, or completed transaction was displayed.

Cause

The hosting/deployment is likely using the wrong account role or environment mapping for the provided test credentials. Instead of authenticating into the customer booking flow, the app is treating the login as an internal staff/operations user and routing to the "Nhân sự vận hành" dashboard. This suggests a role-based redirect/configuration issue, mis-seeded auth data, or a production deployment exposing the operations portal where the customer checkout flow should be reached.

Fix

Separate customer and staff authentication flows on the hosting/app routing side. Ensure the credentials used in the checkout test sign in as a customer account (or a test-only customer role) and are redirected to the payment/booking confirmation page, not the operations dashboard. If the same login endpoint is shared, fix role-based routing/guards so customer bookings continue to checkout after authentication, and verify test credentials are seeded with the correct role/permissions in the deployed environment.

View invoice details for a rental payment

ATTRIBUTES

Status	BLOCKED
Priority	High
Description	Validates that a customer can open an invoice from payment history and inspect the invoice details for a rental.

```

```
145
146    asyncio.run(run_test())
147
```

Error

TEST BLOCKED The customer invoice check could not be completed — the supplied account opened an operations admin dashboard, and no customer payment-history view was available to open. Observations: - The account menu and staff profile showed no customer payment-history or invoice option. - The public page showed rental search and general navigation, but no payment-history or invoice link.

Cause

The most likely hosting-side issue is incorrect account-role provisioning or environment configuration: the deployed service is treating the test credentials as an operations staff/admin account, or the production build is missing the customer invoice/payment-history route due to a bad deploy, stale environment variables, or role-based UI gating. As a result, the automated test cannot find a customer payment-history view and is blocked.

Fix

The hosted frontend appears to be routing the supplied account to an operations/admin role instead of a customer role, so the app never renders a customer invoice/payment-history page. Verify the deployed environment’s auth/role mapping, seeded test user permissions, and any feature-flag or tenant config that determines which dashboard is shown after login. Then ensure there is a customer-facing payment history/invoice route and menu item available for customer accounts, and that the public navbar or profile menu exposes it when the user is authenticated as a customer. If the test account is meant to be a customer, recreate or reconfigure that account in the hosting backend so it loads the correct customer dashboard.

    asyncio.run(run_test())

```

Error

TEST FAILURE The rental booking flow opened for Porsche 911 Carrera 4S, but selecting a vehicle through the showcase could not be confirmed. The booking flow for a vehicle chosen through the showcase therefore remains unverified. Observations: - The showcase continued to display Porsche 911 Carrera 4S after attempts to select Porsche 911 930 Turbo timed out. - A booking dialog appeared for Porsche 911 Carrera 4S, with hourly and long-term rental options.

Cause

The booking flow appears to always resolve to the default/previously selected Porsche 911 Carrera 4S instead of the vehicle chosen in the showcase. This usually indicates a front-end state propagation issue: the showcase click is not updating the selected car, the click is intercepted by an overlapping element, or the booking dialog is reading stale/default vehicle data. The timeout while trying to select Porsche 911 930 Turbo suggests the selection interaction is broken or not exposed reliably in the hosted build.

Fix

Verify the showcase/carousel selection wiring so each tile updates the selected vehicle state before opening the booking modal. In particular, check for a stale state/closure issue or an overlay/slider click target problem where clicks on Porsche 911 930 Turbo are not reaching the intended item. Ensure the showcase items have unique, testable selectors and that the clicked item's vehicle data is passed into the booking dialog. If a modal is auto-opening for the default vehicle, delay dialog opening until the selected vehicle state is confirmed, and remove any CSS/pointer-events/stacking issues that may prevent the showcased vehicle from being selected.

```

Error

TEST FAILURE Long-term subscription packages were displayed, but choosing a package did not visibly continue into the customer rental flow. After login, the page showed the admin operations dashboard instead of the selected package. Observations: - The package section displayed options including “Gói Trải Nghiệm 25 giờ (Edited),” “Gói Doanh Nghiệp & Đường Dài 100 giờ,” and “Gói Tự Động TEST 20261017-001.” - Selecting “Sở hữu thẻ” for “Gói Trải Nghiệm 25 giờ (Edited)” opened a login page. - After login, the admin dashboard was shown, with no selected package or customer rental flow visible.

Cause

The most likely hosting-side issue is that the deployed frontend/backend routing after authentication is defaulting to the admin dashboard and discarding the selected subscription package context. This can happen if the selected package is only held in ephemeral client state, not persisted across the login redirect, or if the deployed auth redirect/role-guard configuration always sends logged-in users to the admin area regardless of the entry point. Another possibility is that the production build is missing the customer-rental redirect handler or has stale/misconfigured routing logic, so the package selection is not carried from the package page to the authenticated rental flow.

Fix

Ensure the package-selection action persists a customer-facing rental context through login and redirects to the correct post-login route. Concretely: store the chosen package ID/type in session or localStorage before sending the user to the auth page, then after successful login read that context and route the user into the customer rental flow instead of the default role-based landing page. Also verify the auth callback/redirect logic does not always send authenticated users to the admin dashboard by default; it should preserve the original destination or branch by role and selected package. If the app is hosted as a static frontend, check environment variables and deployed routing rules for missing customer-flow routes, and confirm the login page/pass-through state isn’t being lost on refresh or cross-origin navigation.

```

Error

PASS — The Porsche 911 930 Turbo (1975) was selected in the interactive showcase and remains displayed with its vehicle details. Observations: - The showcase displays the selected Porsche 911 930 Turbo (1975) and its vehicle image. - The details panel shows year 1975 and engine configuration 3.0L Air-Cooled Turbo. - The details panel shows 260 Mã Lực (191 kW) and a top speed of 250 km/h.

Cause

The most likely cause is a false negative in the test or monitoring pipeline rather than a hosting issue: the app rendered the correct vehicle, image, and specs, so the failure may come from an assertion mismatch, timing/flakiness, or an outdated expected snapshot. If this was reported as a failure despite the displayed content being correct, the host-side service is probably healthy and the issue lies in the automated test configuration or selector used to validate the showcase state.

Fix

No service-side fix appears necessary for this specific result, since the interactive showcase is functioning as expected and the Porsche 911 930 Turbo (1975) remains correctly displayed with its details. If the automated report is incorrectly marking this as a failure, the likely remediation is to fix the test/monitoring expectation or selector logic rather than the hosted app. On the service side, verify the deployed build is up to date and that the showcase data is being served consistently, but no functional defect is indicated by the observed output.

Set up an hourly rental trip

74
```

Error

TEST FAILURE The hourly rental schedule could not be configured. The trip setup widget displayed a schedule control, but it did not open, so a pickup and return time could not be selected and matching vehicles could not be verified. Observations: - “Thuê theo giờ” was selected. - The widget displayed pickup location “TP. Hồ Chí Minh (Tất cả chi nhánh)” and schedule “21:00 T3, 20/10 — 20:00 T4, 21/10.” - Attempts to open the schedule control timed out; no schedule choices or vehicle results appeared.

Cause

The hosting-side failure is most likely a broken or non-interactive schedule picker in the deployed frontend: the hourly rental schedule control renders text but does not open because its click/tap handler is not firing or the popup is being suppressed by an overlay, CSS pointer-events issue, or a JavaScript/runtime error in the production bundle. Another possibility is that the component depends on data or state that fails to load on the hosted environment, leaving the control visually present but unusable.

Fix

Inspect the hourly-rental schedule widget on the production build: the date/time dropdown or popup is likely blocked by a JS error, broken event handler, z-index/overlay issue, or a disabled third-party calendar/timepicker component. Check browser console for runtime errors, confirm the control is mounted and clickable in the deployed bundle, and verify no CSS/overlay element is intercepting pointer events. If the widget depends on client-side data, ensure the API responses are healthy and the component initializes after load. Redeploy a fixed build and validate that the schedule picker opens and allows selecting pickup/return times.

71
72    asyncio.run(run_test())
73
```

Error

TEST FAILURE The long-term rental selection flow could not be verified. "Thuê dài hạn FLEX" is selected on the homepage, but the rental selection screen and a vehicle or plan option did not appear after attempts to continue. Observations: - The homepage search panel shows "Thuê dài hạn FLEX" selected. - The panel still shows the pickup location and itinerary controls with the "Tìm Xe" button. - No long-term selection flow or plan choices are visible.

Cause

The most likely hosting-side issue is that the live site is loading an incorrect or stale frontend artifact from the deployment/CDN, so the UI can display the "Thuê dài hạn FLEX" label but the code that should switch to the long-term rental flow is missing, broken, or not being executed. Another possibility is a mismatch between the deployed frontend and backend/config, causing the long-term rental route or data fetch to fail silently and leaving the page in the default short-term search state.

Fix

Likely the hosting build is serving an outdated or partially deployed frontend bundle where the long-term FLEX booking mode is not wired to a separate continuation flow. Rebuild and redeploy the production frontend so the homepage selection changes the search panel state and routes to the long-term rental screen/plan selector. Verify the client-side event handlers, routing, and any feature-flag/API payload for the “Thuê dài hạn FLEX” option, and clear CDN/edge cache so the latest JS/CSS are actually served.

Error

Test failed at step 13 (click) — Choose “Đặt xe” on the VinFast VF 8 Plus card and inspect the long-term booking options. Error: Failed to click element 3945: Event handler browser_use.browser.watchdog_base.DefaultActionWatchdog.on_ClickElementEvent#1776(?▶ ClickElementEvent#3e98 ⛹) timed out after 15.0s

Cause

The click on the "Đặt xe" button likely does not complete because the frontend is blocking or the target is not reliably clickable on the hosting page. Common hosting-side causes are: a runtime error or long-running synchronous operation in the click handler, a hidden overlay/spinner intercepting the click, an element re-render that replaces the button during the click, or a very slow network/API request that prevents the UI from reacting within the 15s watchdog timeout. This makes the browser automation wait until it times out when trying to inspect the long-term booking options.

Fix

Check the "Đặt xe" button interaction for the VinFast VF 8 Plus card and ensure it responds immediately to clicks without opening a blocking modal or running a long synchronous task. Potential fixes include: (1) verify the click target is not covered by an overlay/animation or disabled by CSS; (2) make the booking options panel/modal open with a fast, non-blocking state update; (3) move heavy data fetching or rendering off the click handler and show a loading state asynchronously; (4) ensure the button has a proper onClick handler and accessible hit area; (5) if the component is inside a carousel/scroll container, make sure the click does not trigger a conflicting drag/scroll listener. If the issue is caused by slow rendering of the long-term booking options, optimize that render path or lazy-load the content after the click returns.

Start a long-term rental booking from the homepage

Error

Test failed at step 4 (click) — Select the VinFast VF 8 Plus using its visible “Đặt xe” button and verify whether the rental setup flow opens. Error: Failed to click element 900: Event handler browser_use.browser.watchdog_base.DefaultActionWatchdog.on_ClickElementEvent#2576(?▶ ClickElementEvent#8d0a 🏃) timed out after 15.0s

Cause

The click timed out because the host page likely exposed a visible “Đặt xe” button that was not actually actionable within the browser automation window. This usually happens when the button is covered by another element, disabled by state, or the click handler is blocked/stuck by frontend JavaScript errors, long-running async work, or a navigation that never resolves. In short, the UI looked clickable, but the hosting-side app implementation prevented the click event from completing and opening the rental setup flow.

Fix

Inspect the “Đặt xe” button for the VinFast VF 8 Plus card and ensure it is a real, enabled, clickable control that triggers the rental setup route/modal immediately. Common fixes on the hosting/app side: remove any invisible overlay or loading layer covering the button, avoid CSS properties that block pointer events, make sure the click handler is bound correctly and does not wait on a stalled async operation before navigation, and verify the target page/route is reachable without hanging network requests. If the card is rendered dynamically, ensure the button becomes interactive only after data hydration completes and that no client-side error prevents the click action from firing.

            if pw:
                await pw.stop()

    asyncio.run(run_test())

```

Error

TEST BLOCKED The subscription-style booking flow could not be verified — attempts to proceed from the rental page timed out, and the date/time dialog remained open. Observations: - “Thuê dài hạn / FLEX” was selected. - The date/time dialog with an “Xác nhận” button remained visible. - Subscription package options and a chosen package in the booking flow were not reached or verified.

Cause

The most likely hosting-side issue is a broken frontend interaction in the production build for the long-term/FLEX booking flow: the date/time dialog is opening but the confirm action is not completing, so the app never transitions to the subscription package selection step. This can happen if the deployed bundle has a missing or mismatched event handler, a runtime JavaScript error after selecting FLEX, a stale cached asset/version mismatch, or a backend/API dependency failure that prevents the next step from rendering.

Fix

Inspect the rental-page booking flow for the FLEX/subscription path and ensure the date/time picker’s Confirm (Xác nhận) action actually closes the dialog and advances the UI to the next step. Likely fixes include wiring the confirm button to the correct state update/navigation handler, removing any broken validation that prevents submission, and checking for frontend errors or blocked API calls in production that leave the modal open. Also verify the hosted build contains the latest JS/CSS assets and that no overlay/z-index or disabled-button issue is preventing clicks from being processed.

Error

Test failed at step 3 (click) — Submit the visible “Tìm Xe” search with the displayed rental schedule and inspect the schedule results. Error: Failed to click element 503: Event handler browser_use.browser.watchdog_base.DefaultActionWatchdog.on_ClickElementEvent#2896(?▶ ClickElementEvent#0de4 🏃) timed out after 15.0s

Cause

The click on the visible search submit likely triggers a slow or stuck action in the hosted app—such as a long-running fetch, blocked event loop, unhandled exception, or an overlay that prevents the button from receiving the click—causing the browser automation watchdog to time out after 15s. In practice, the deployed service may be waiting on a backend request that never resolves, has a broken submit handler in production, or is rendering the button in a state that is clickable to humans but not to automation because of an overlapping element or disabled transition.

Fix

Optimize the search form submit flow so the visible “Tìm Xe” button responds immediately. On the hosting/app side, this likely means avoiding a blocking synchronous operation on click, ensuring the handler is correctly attached in the deployed build, and moving any slow API/database work off the main thread or into a fast async request with proper loading state. Also check for frontend runtime errors, CORS/API timeouts, or an overlay/spinner that may be intercepting the click in the deployed environment. If this is a Cloudflare Workers deployment, verify the worker route is healthy, cold-start latency is low, and the search endpoint returns quickly enough for automated interaction tests.
